

Warm Up:

1. $4 + 3 + 2 \cdot 5$
2. $2/5 - 1/10 \div 3/5$
3. $(25 - 4^2) \cdot 3 + 2$
4. $(16 - 3^2) + (2 + 3)^2$
5. Ravi earned \$30 on Monday and twice as much on Tuesday. On Wednesday, he spent half of the money he earned on Monday and Tuesday. How much did he have left?

Key Concept — The Distributive Property

Distributive Property	
Words:	
Symbols:	
Examples:	

A look ahead...

Using the Symmetric Property, you can write the distributive property in reverse order:

This is called factoring.

Example 1: Applying the Distributive Property

- In a recent year, the median salary for an engineer in the United States was \$55,000 and the median salary for a computer programmer was \$52,000.

A) Write an expression to estimate the cost for a business to employ an engineer and a computer programmer for 5 years.

B) Evaluate the expression to estimate the total cost for a business to hire both for 5 years.

Example 2: Mental Math

- $4(23)$
- $5 \cdot 99$
- $4 \cdot 1002$
- $5(4 \frac{1}{5})$

Example 3: Distribute an Algebraic Expression

- $4(5x - 7)$
- $(3y^2 + y - 8)6$
- $-6(r + 3g - t)$
- $(-2m + 5b - 2k)2$
- $-4(4a + 2b - (1/2)c)$

Combine Like Terms (CONCEPT CHECK)

Simplify each expression, if possible.

- $14a + 18a$
- $4b^2 + 9b - 3b$
- $b^2 + 13b + 13$

Example 4: Write and Simplify Expressions

- three times the sum of $2x$ and $3y$, decreased by twice the difference of 4 and y
- the product of 9 and t squared, increased by 3 times the sum of 2 and t squared

Example 5: Simplify Using the Distributive Property

- $6d + 4(3d + 5)$
- $4(fg + 3g) + 5g$
- $2(n + 2n - 5)$

Tonight's Homework:
