midsegment of a trapezoid:

Kite and Trapezoid Theorems

Kite: the diagonals are _____, and exactly **ONE** pair of opposite angles is congruent — the angles between the **NON**-congruent sides.

Isosceles trapezoid: each pair of base angles is _____, and the diagonals are _____ (both are if-and-only-if).

Trapezoid Midsegment Theorem: the midsegment is _____ to both bases, and its length is _____ the **SUM** of the bases.

Example 1 - Kite Angles

In kite ABCD at the right, $\overline{AB} \cong \overline{AD}$, $\overline{CB} \cong \overline{CD}$, $m\angle BAD = 48^\circ$, and $m\angle ABC = 121^\circ$.

- Which angles must be congruent? Why?
- Find $m\angle ADC$.
- Find $m\angle BCD$.
- What is $m\angle AEB$, where the diagonals meet at E?

Example 2 - Make It Isosceles

In trapezoid JKLM at the right, $\overline{JM}$ and $\overline{KL}$ are the legs, $JM = 8x - 15$, and $KL = 5x + 9$.

- Find x so that JKLM is isosceles.
- Find the length of each leg.

Example 3 - Use the Midsegment Theorem

Each trapezoid at the right shows its midsegment.

- Find EF in the first figure (bases 23 and 15).
- Find GH in the second figure (midsegment 17, one base 12).

Example 4 - Midsegment Algebra

In the trapezoid at the right, the bases measure $9x - 7$ and $5x + 3$, and the midsegment measures 47.

- Write the equation and solve for x .
- Find both bases and check.

Example 5 - Trapezoid Angles

In isosceles trapezoid PQRS at the right, $\overline{PQ} \parallel \overline{SR}$ and $m\angle P = 68^\circ$.

- Find $m\angle S$.
- Find $m\angle Q$ and $m\angle R$.
